Free-Response Question 1

Applying the Scoring Criteria

Apply the question scoring criteria first, which always takes precedence. Penalty points can only be deducted in a part of the question that has earned credit via the question rubric. No part of a question (a, b, c) may have a negative point total. A given penalty can be assessed only once for a question, even if it occurs multiple times or in multiple parts of that question. A maximum of 3 penalty points may be assessed per question.

1-Point Penalty

- v) Array/collection access confusion ([] get)
- w) Extraneous code that causes side-effect (e.g., printing to output, incorrect precondition check)
- x) Local variables used but none declared
- y) Destruction of persistent data (e.g., changing value referenced by parameter)
- z) Void method or constructor that returns a value

No Penalty

- Extraneous code with no side-effect (e.g., valid precondition check, no-op)
- Spelling/case discrepancies where there is no ambiguity*
- Local variable not declared provided other variables are declared in some part
- private or public qualifier on a local variable
- Missing public qualifier on class or constructor header
- Keyword used as an identifier
- Common mathematical symbols used for operators (x ÷ ≤ ≥ <> ≠)
- [] vs. () vs. <>
- = instead of == and vice versa
- length/size confusion for array, String, List, or ArrayList; with or without ()
- Extraneous [] when referencing entire array
- [i, j] instead of [i][j]
- Extraneous size in array declaration, e.g., int[size] nums = new int[size];
- Missing ; where structure clearly conveys intent
- Missing { } where indentation clearly conveys intent
- Missing () on parameter-less method or constructor invocations
- Missing () around if or while conditions

*Spelling and case discrepancies for identifiers fall under the "No Penalty" category only if the correction can be **unambiguously** inferred from context, for example, "ArayList" instead of "ArrayList". As a counterexample, note that if the code declares "int G=99, g=0;", then uses "while (G<10)" instead of "while (g<10)", the context does **not** allow for the reader to assume the use of the lower case variable.

Canonical solution

```
(a) public int getScore()
                                                                      4 points
       int score = 0;
       if (levelOne.goalReached())
          score = levelOne.getPoints();
          if (levelTwo.goalReached())
             score += levelTwo.getPoints();
             if (levelThree.goalReached())
                score += levelThree.getPoints();
          }
       }
       if (isBonus())
          score *= 3;
      return score;
    }
(b) public int playManyTimes(int num)
                                                                      5 points
       int max = 0;
       for (int i = 0; i < num; i++)
         play();
          int score = getScore();
          if (score > max)
            max = score;
       }
      return max;
```

(a) getScore

	Scoring Criteria	Decision Rules	
1	Calls getPoints, goalReached, and isBonus	Responses will not earn the point if they • fail to call getPoints or goalReached on a Level object • call isBonus on an object other than this (use of this is optional) • include parameters	1 point
2	Determines if points are earned based on goalReached return values	Responses can still earn the point even if they calculate the score total incorrectly call goalReached incorrectly fail to distinguish all cases correctly Responses will not earn the point if they fail to use a nested if statement or equivalent	1 point
3	Guards update of score for bonus game based on isBonus return value	Responses can still earn the point even if they • triple the calculated score incorrectly • update the score with something other than tripling • call isBonus incorrectly Responses will not earn the point if they • use the isBonus return value	1 point
4	Initializes and accumulates appropriate score (algorithm)	incorrectly Responses can still earn the point even if they call methods incorrectly, as long as method calls are attempted fail to return the score (return is not assessed) Responses will not earn the point if they calculate the score total incorrectly triple the calculated score incorrectly	1 point

Total for part (a) 4 points

(b) playManyTimes

	Scoring Criteria	Decision Rules	
5	Loops num times	Responses can still earn the point even if they	1 point
6	Calls play and getScore	Responses will not earn the point if they call either method on an object other than this (use of this is optional)	1 point
7	Compares a score to an identified max or to another score	Responses can still earn the point even if they make the comparison outside the loop call getScore incorrectly fail to call play between calls to	1 point
8	Identifies the maximum score (algorithm)	Responses will not earn the point if they fail to initialize the result variable compare a score to an identified max or to another score outside the loop fail to call play exactly once each	1 point
9	Returns identified maximum score	 call either method on an object other than this (use of this is optional) include parameters ax or to Responses can still earn the point even if they make the comparison outside the loop call getScore incorrectly fail to call play between calls to getScore rithm) Responses will not earn the point if they fail to initialize the result variable compare a score to an identified max or to another score outside the loop fail to call play exactly once each time through the loop Responses can still earn the point even if they calculate the maximum score incorrectly Responses will not earn the point if they assign a value to the identified maximum score without any loop or logic to find the maximum 	1 point
		Total for part (b)	5 points
	Question-specific penalties		
	None

Q5327/3

Question 1

Note: Student samples are quoted verbatim and may contain spelling and grammatical errors.

Overview

This question tested the student's ability to:

- Write program code to call methods.
- Write program code to satisfy method specifications using expressions, conditional statements, and iterative statements.

More specifically, this question assessed the ability to use Level objects, call methods within and outside the current class, use nested if logic to calculate a correct score for each level depending on whether that level and all previous levels' goals were met, iterate a specific number of times to identify a maximum score, and use method return values in conditional expressions.

In part (a) students were asked to declare and initialize a numeric score variable and then call the getPoints and goalReached methods from the Level class on the instance variables levelOne, levelTwo, and levelThree in order to calculate a correct score for each level, depending on whether that level and all previous levels' goals were met. Students then had to evaluate the returned value from isBonus to determine if the score for the game is tripled before being returned.

In part (b) students were asked to declare and initialize a maximum value variable, iterate <code>num times</code> to call the <code>play</code> method, and compare the value returned from <code>getScore</code> to the identified maximum, replacing the maximum as needed in the loop after a correct comparison. The students then had to return the identified maximum score.

Sample: 1A Score: 8

In part (a) point 1 was earned by using the correct syntax to call each method, without parameters, at least once. The methods of the Level class, <code>getPoints</code> and <code>goalReached</code>, are correctly called on the instance variables <code>levelOne</code>, <code>levelTwo</code>, and <code>levelThree</code>. The <code>isBonus</code> method is also called correctly. Point 2 was earned by using <code>goalReached</code> return values to determine if points should be included in the score. Responses can earn point 2 even if they do not correctly determine which points should be added to the score or if they do not call <code>goalReached</code> correctly. Point 3 was earned by correctly using the result of <code>isBonus</code> to determine if a bonus should be added to the score. Responses can still earn point 3 even if they do not calculate the bonus correctly or if they call <code>isBonus</code> incorrectly. (The <code>isBonus</code> call is assessed in point 1.) Point 4 was earned because the variable <code>sum</code> is initialized and used to calculate the correct score. Responses can still earn point 4 even if the <code>return</code> statement is omitted. Calculation of a correct score for levels 2 and 3 depends on whether or not the goal was reached on previous levels. When the condition used to check if a previous level's goal has been reached is missing or incorrect, or if the bonus is incorrectly computed, point 4 is not earned.

Question 1 (continued)

In part (b) point 5 was earned because the response correctly uses a for loop to iterate num times. Point 6 was not earned because the play and getScore method calls are incorrect. The response uses the class name, Game, to access the methods, which is incorrect since neither play nor getScore is a static method. The methods are members of the Game class, as is the method being written. Therefore, the correct method calls are play() and getScore(). Responses may include the this keyword in calls to these methods. Point 7 was earned because the response compares an identified maximum variable, highScore, with another score. This point can be earned even if the getScore method is called incorrectly or if the values being compared are incorrect. However, the values compared must be identified scores or maximum values. Point 8 was earned because the response implements the correct algorithm to identify the maximum score. The play method must be called exactly once each time through the loop, and the maximum score must be appropriately updated in order for this point to be earned. The response correctly initializes the maximum value variable, highScore, and updates that variable inside the loop as needed. Point 9 was earned by returning the identified maximum score stored in highScore. To earn this point, there must be logic to find the maximum or there must be a loop and calculations on the variable that is returned. The value returned does not have to be the correct maximum score, nor even a maximum, to earn this point.

Sample: 1B Score: 5

In part (a) point 1 was not earned because the <code>isBonus</code> method is called incorrectly. The method call <code>Game.isBonus()</code> is incorrect since <code>isBonus</code> is not a static method and is a member of the same class as the method being written. Responses may include the <code>this</code> keyword in the method call <code>(this.isBonus())</code>. The <code>getPoints</code> and <code>goalReached</code> methods are called correctly, but all three method calls must be correct in order to earn this point. Point 2 was not earned. Even though the <code>goalReached</code> method is called correctly, there is no attempt to add points only if the goals of the current level and all previous levels are reached. In order to earn this point, there must be code that includes level 2's points in the score only if the goals of levels 1 and 2 are reached or code that includes level 3's points in the score only if the goals of levels 1, 2, and 3 are all reached. This point could have been earned if either the level 2 points or the level 3 points were correctly handled. Point 3 was earned because the <code>isBonus</code> return value is used to determine whether the bonus should be added. Point 4 was not earned because points from levels 2 and 3 are added to the score if the goal of the current level is reached, regardless of whether the previous levels' goals were reached. To earn this point, both the level 2 points and level 3 points must be correctly handled.

In part (b) point 5 was earned because the <code>for</code> loop starts at 1 and loops while <code>i <= num</code>, so the body of the loop is executed exactly <code>num</code> times. Point 6 was not earned because the response incorrectly uses the class name, <code>Game</code>, to access the <code>play</code> and <code>getScore</code> methods. Point 7 was earned because the <code>if</code> statement compares a score with the identified maximum variable, <code>highScore</code>. This point was earned, even though the response calls <code>getScore</code> incorrectly, because the incorrect method call is assessed in point 6. Point 8 was earned because the response correctly identifies the maximum score by declaring a maximum variable, <code>highScore</code>; initializing it

Question 1 (continued)

to zero; and updating it as needed in the loop after a correct comparison. Point 9 was earned by returning the identified maximum, highScore.

Sample: 1C Score: 2

In part (a) point 1 was not earned because the <code>isBonus</code> method is called incorrectly. All method calls must be correct in order to earn this point. Point 2 was not earned. Even though the <code>goalReached</code> method is called correctly, there is no attempt to add points only if the goals of the current level and all previous levels are reached. Point 3 was earned because the <code>isBonus</code> return value is used to determine whether the bonus should be applied. The incorrect call to <code>isBonus</code> does not affect this point as the correctness of the method call was assessed in point 1. Point 4 was not earned because the <code>sequential if</code> statements in the response do not accumulate the appropriate score. Note that no points were deducted for the missing <code>return</code> statement in part (a).

In part (b) point 5 was earned because the <code>for</code> loop iterates exactly <code>num</code> times. Point 6 was not earned because the response calls the <code>play</code> and <code>getScore</code> methods on an object other than <code>this</code>. Point 7 was not earned because there is no comparison of a score with another score or with an identified maximum value. Point 8 was not earned because the response does not correctly identify a maximum score. There are no comparisons in the loop, and the loop creates a new <code>Game</code> object in each iteration, which eliminates the possibility of a maximum. Point 9 was not earned because there is no <code>return</code> statement and no variable to hold a score or calculated value that could be returned.
